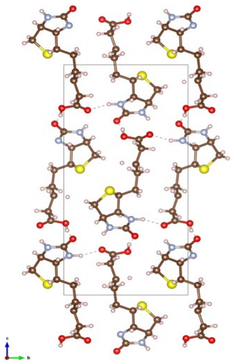
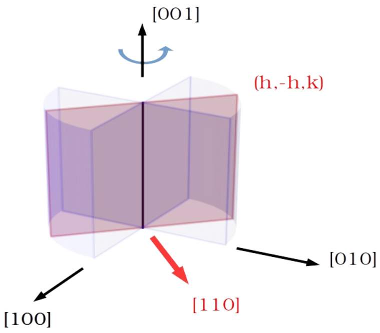
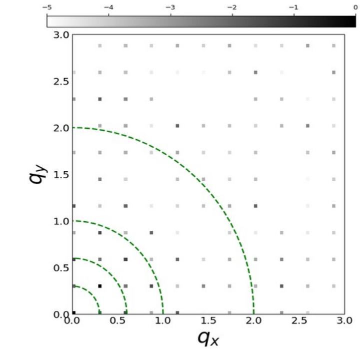
Simulation of Dynamical Scattering Effect in Electron Diffraction Patterns

Tarik Drevon, David Waterman, Eugene Krissinel





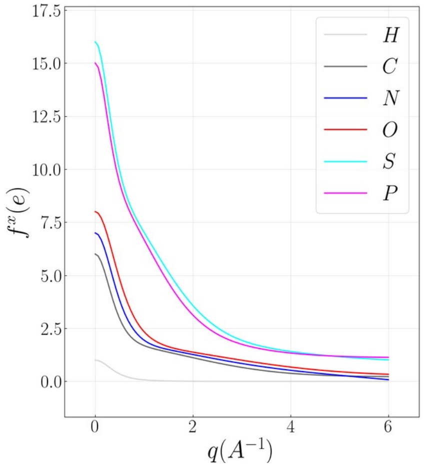


X-ray (MX) vs electron diffraction (ED) for biotin

MX 12keV ≅ 1Å

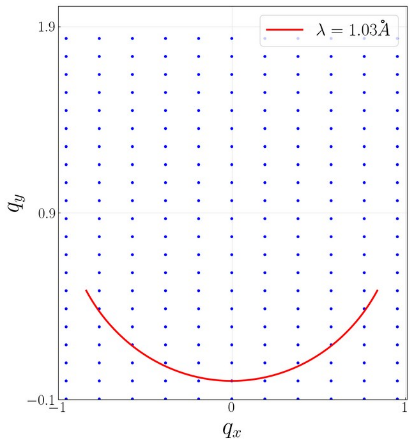
Form factor

- Electronic density
- Thomson scattering
- Small cross section
- Kinematic scattering



Ewald sphere curvature

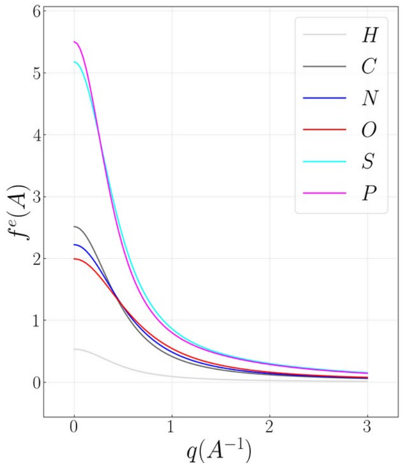
- Large curvature
- High order Laue zones
- Thick sample t=20μm
- Narrow rocking curve



ED 200keV ≅ 0.025Å

Form factor

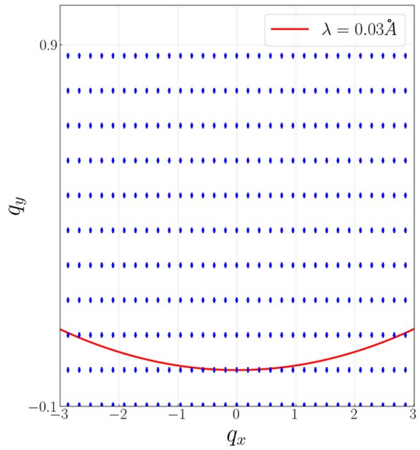
- Electrostatic potential
- Coulomb scattering
- Large cross section
- Dynamical scattering
- Mott-Bethe formula



$$f^e(q) = \frac{1}{2\pi^2 a_0} \frac{Z - f^x(q)}{q^2}$$

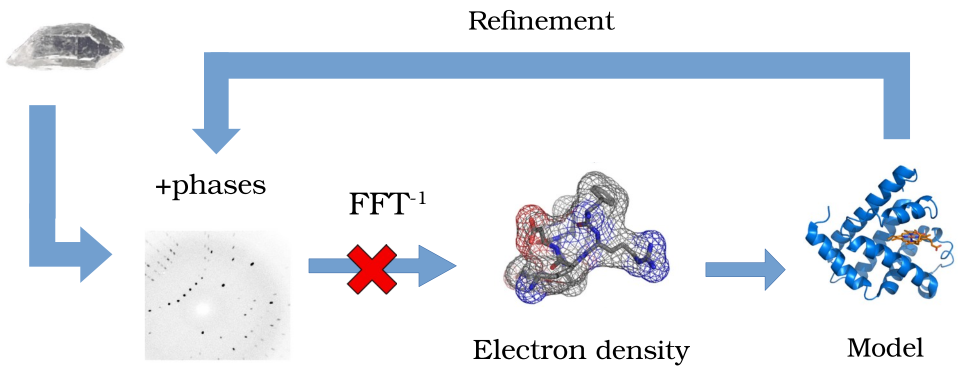
Ewald Sphere curvature

- Flat Ewald sphere
- First order Laue zone
- Thin sample t=0.2μm
- Wide rocking curve
- Thickness dependent rocking curve shape



Numerical simulation tools of ED patterns

Kinematic approximation



Schroedinger’s fast electron wave equation

$$\left\{\frac{\hbar^2}{2m_0}\nabla^2 + V(\mathbf{r})\right\}\Psi(\mathbf{r}) = E\Psi(\mathbf{r})$$

$$\partial_z^2 \ll 2ik_0\partial_z$$

$$\frac{\partial\Psi(x,y,z)}{\partial_z} = \left\{\frac{i\lambda}{4\pi}\nabla^2_{xy} + i\sigma V(x,y,z)\right\}\Psi(x,y,z)$$

Kinematic theory of scattering

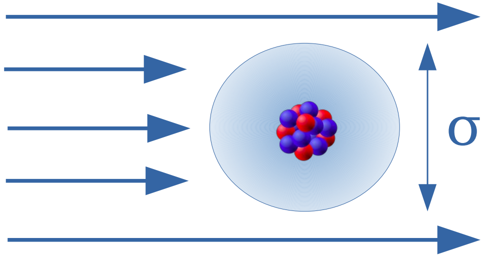
Kinematic solution

$$\Psi(\mathbf{r}) = e^{ikz} + f(\theta)\frac{e^{i\mathbf{k}\cdot\mathbf{r}}}{|\mathbf{r}|}$$

Born approximation

$$f(\theta) = -\frac{2me}{h^2}\int d^3r e^{i\mathbf{q}\cdot\mathbf{r}}V(r) \;,\quad \frac{d\sigma}{d\Omega} = |f(\theta)|^2$$

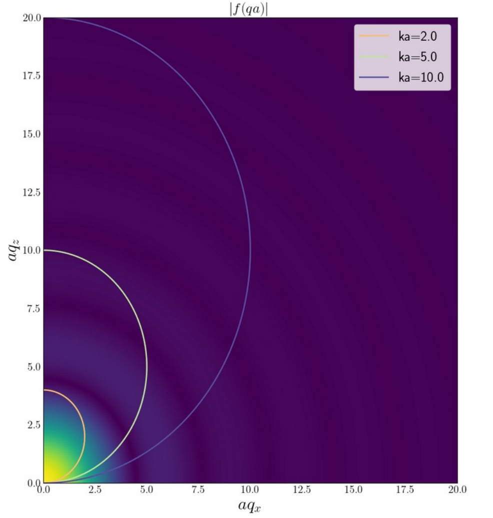
$$P_{scattered} = \sigma\phi_{incident}$$

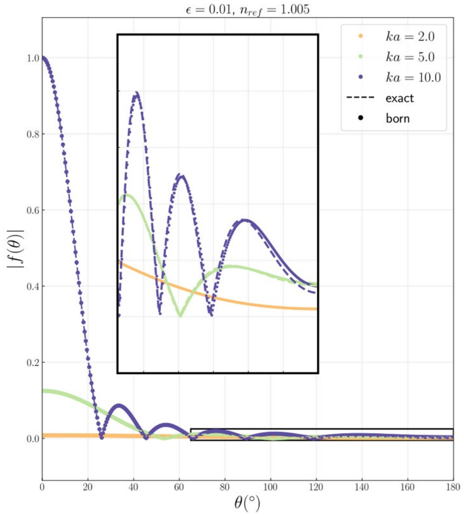


Application to scattering by a single qdot sphere

$$f(q) = \frac{V_0}{E}\frac{a^3k_0^2}{q^2a^2}\left(-\cos qa + \frac{\sin qa}{qa}\right)$$

$$q = 2k_0 \sin\frac{\theta}{2}$$



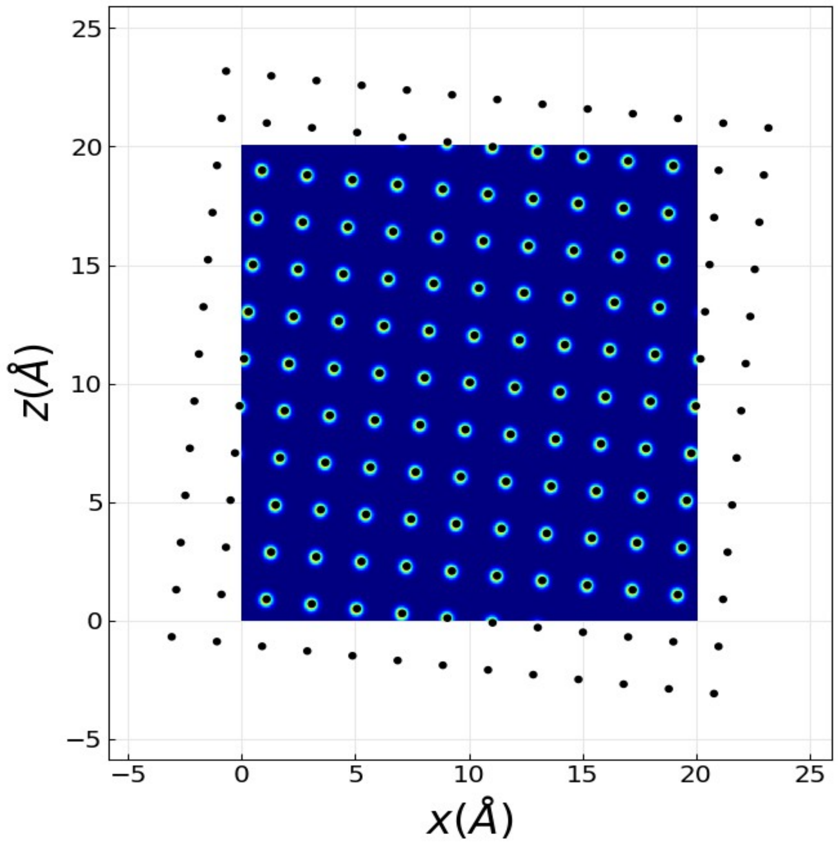


Numerical simulation tools of ED patterns

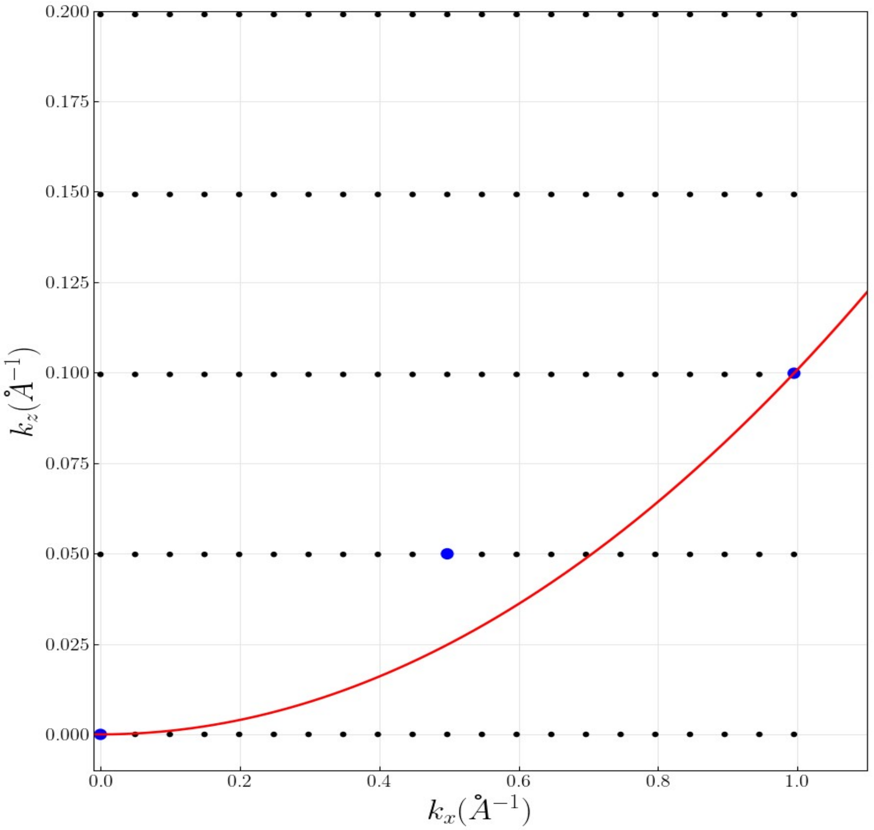
Method	Exact	Speed	Mem (beam per atom)	Periodic structure	Grid based	Parallelization type	Package
Multislice (MS) (physical optics based approach)	no	$N_z N_b \log N_b$	100	**yes**	**yes**	FFTw one slice after another	**TEMSIM (pyMS)** PRISM,...
Near bragg (real space path differences)	no	$N_z N_b^2 N_p$	1	**no**	**no**	per pixel	NearBragg (James Holton)

Multislice 2-beam diffraction case

Simulation setup



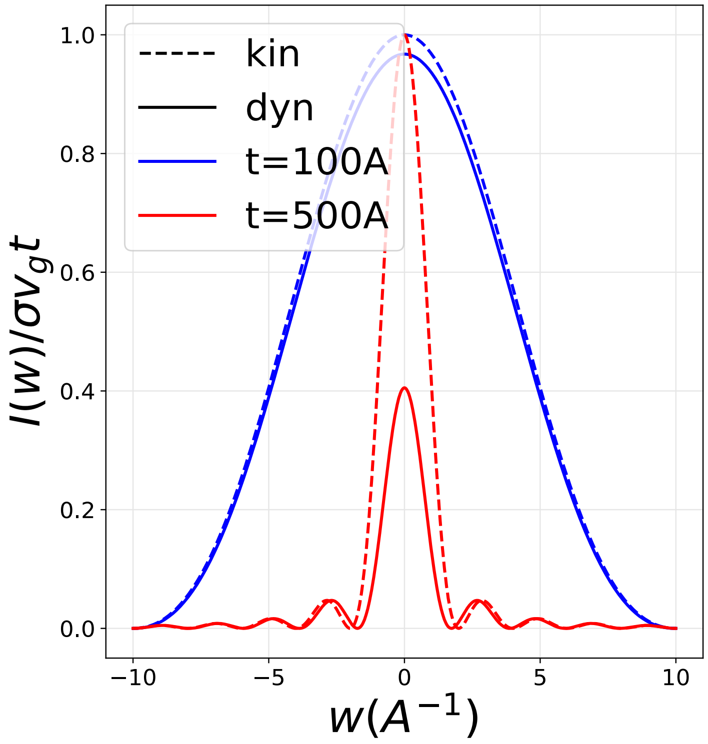
Ewald configuration



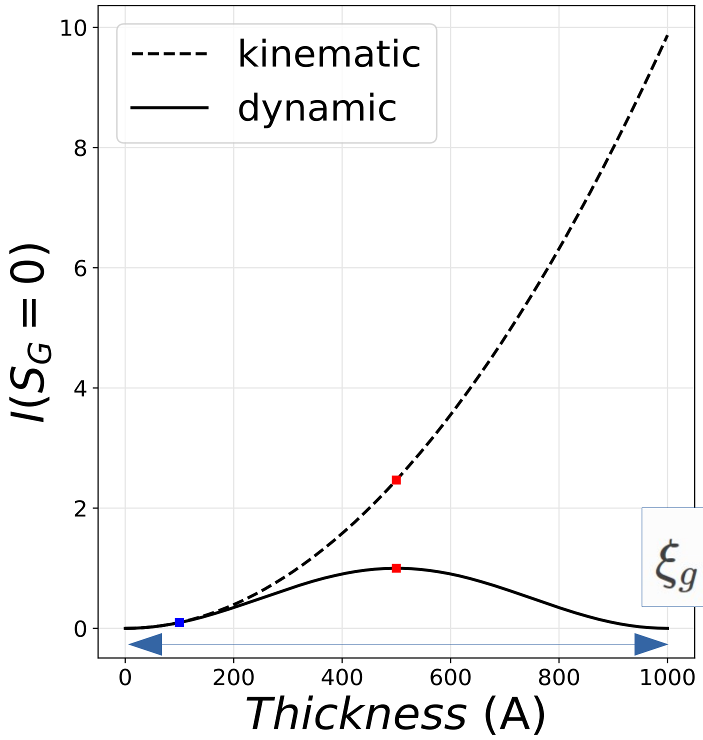
Theoretical 2-beam rocking curves

Beam intensity with excitation error $w_g = \xi_g S_G$ and thickness t

$$I_{dyn-2}(w_g;t,\xi_g) = \left(\frac{\pi t}{\xi_g}\right)^2 sinc^2\left(\frac{t}{\xi_g}\sqrt{1+\boxed{w_g^2}}\right)$$



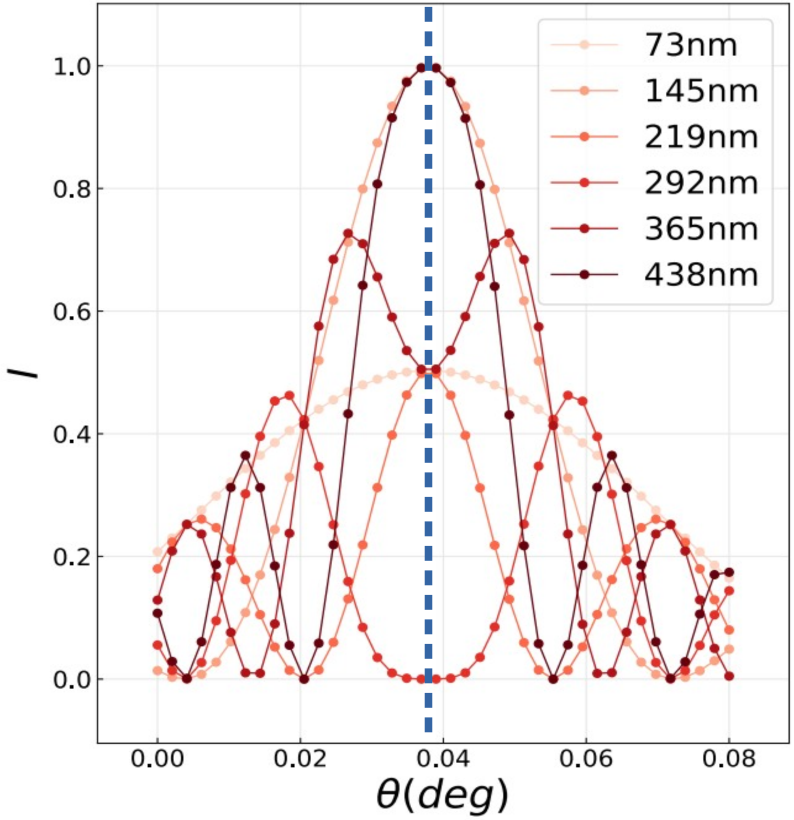
No excitation error



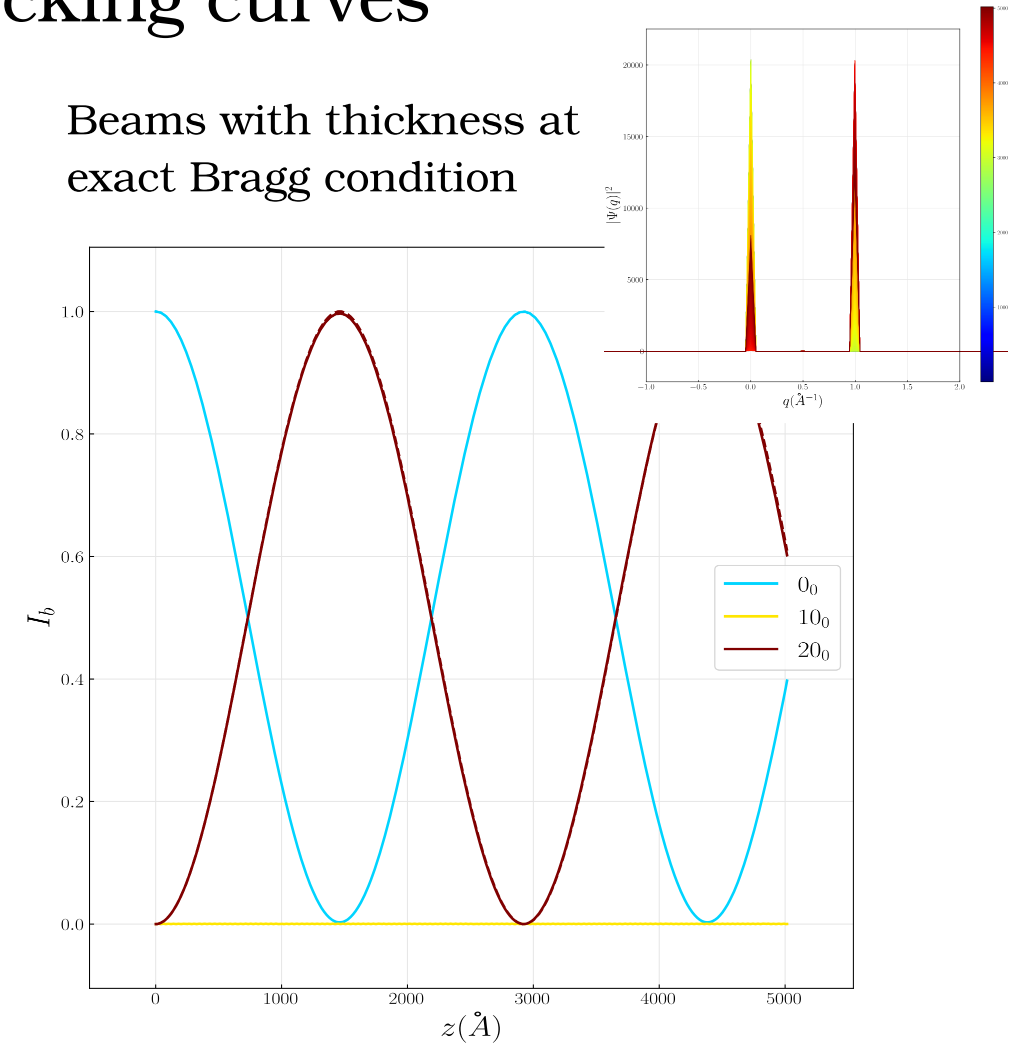
$$\xi_g = k_0/U_g$$

Simulated rocking curves

Rocking curves at different different thicknesses

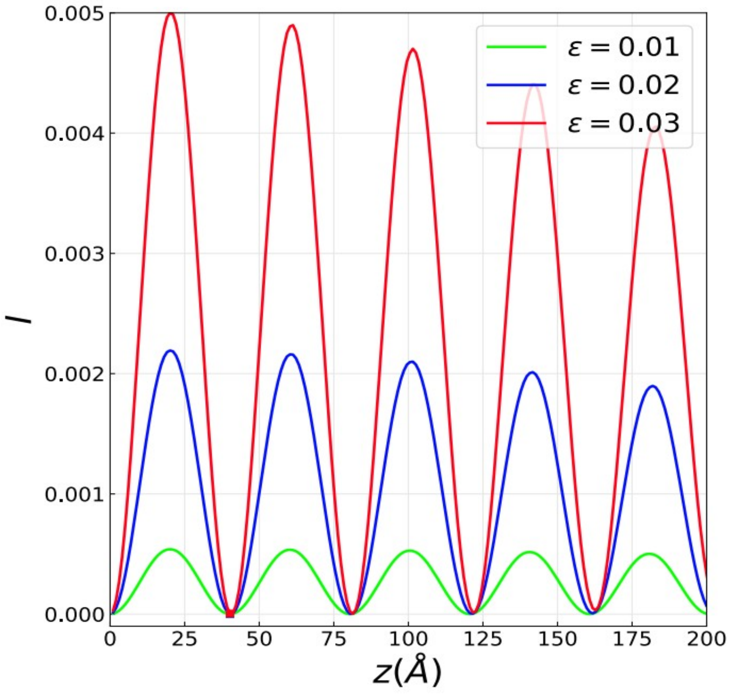


Beams with thickness at exact Bragg condition

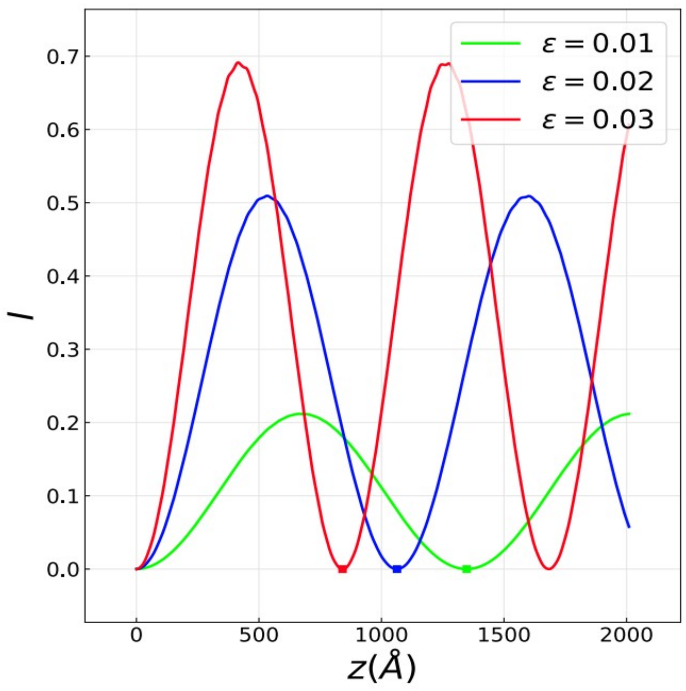


Extinction distance : Kinematic vs Dynamical diffraction

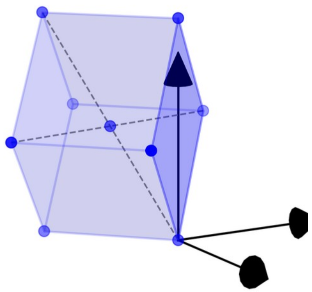
Kinematic : Ewald sphere curvature effect of weakly excited beams with identical excitation errors



Potential dependent extinction for strongly excited beams with identical excitation errors



Diffraction pattern for biotin

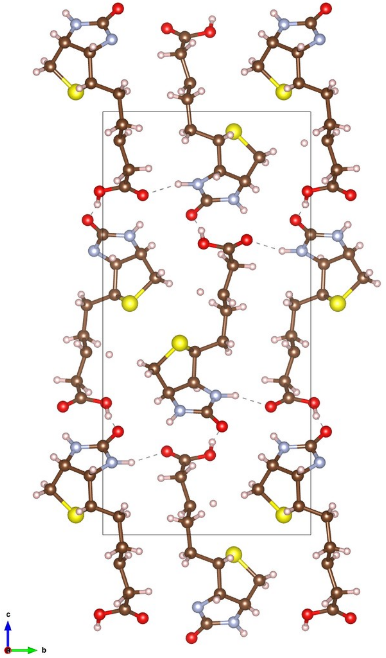


$C_{10}H_{16}N_2O_3S$

Structure : $P2_12_12_1$

alpha=90, beta=90, gamma=90

a=5.24A, b=10.35A, c=21.04A



[401]=45deg

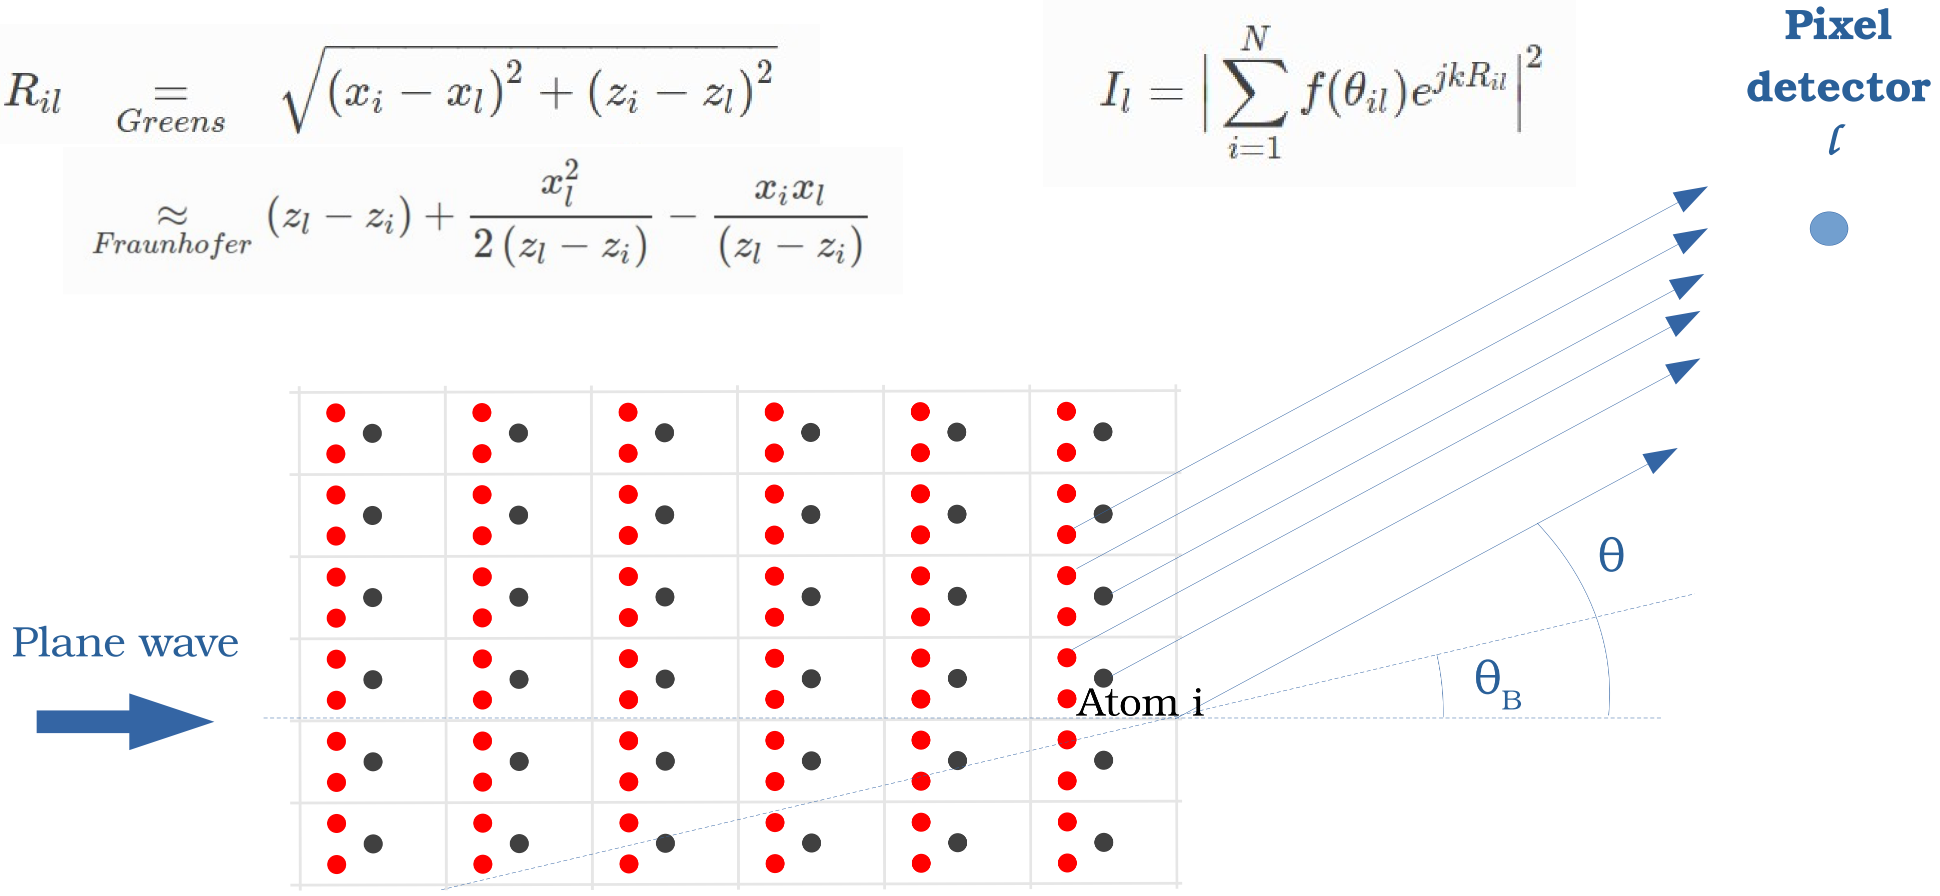
Near Bragg

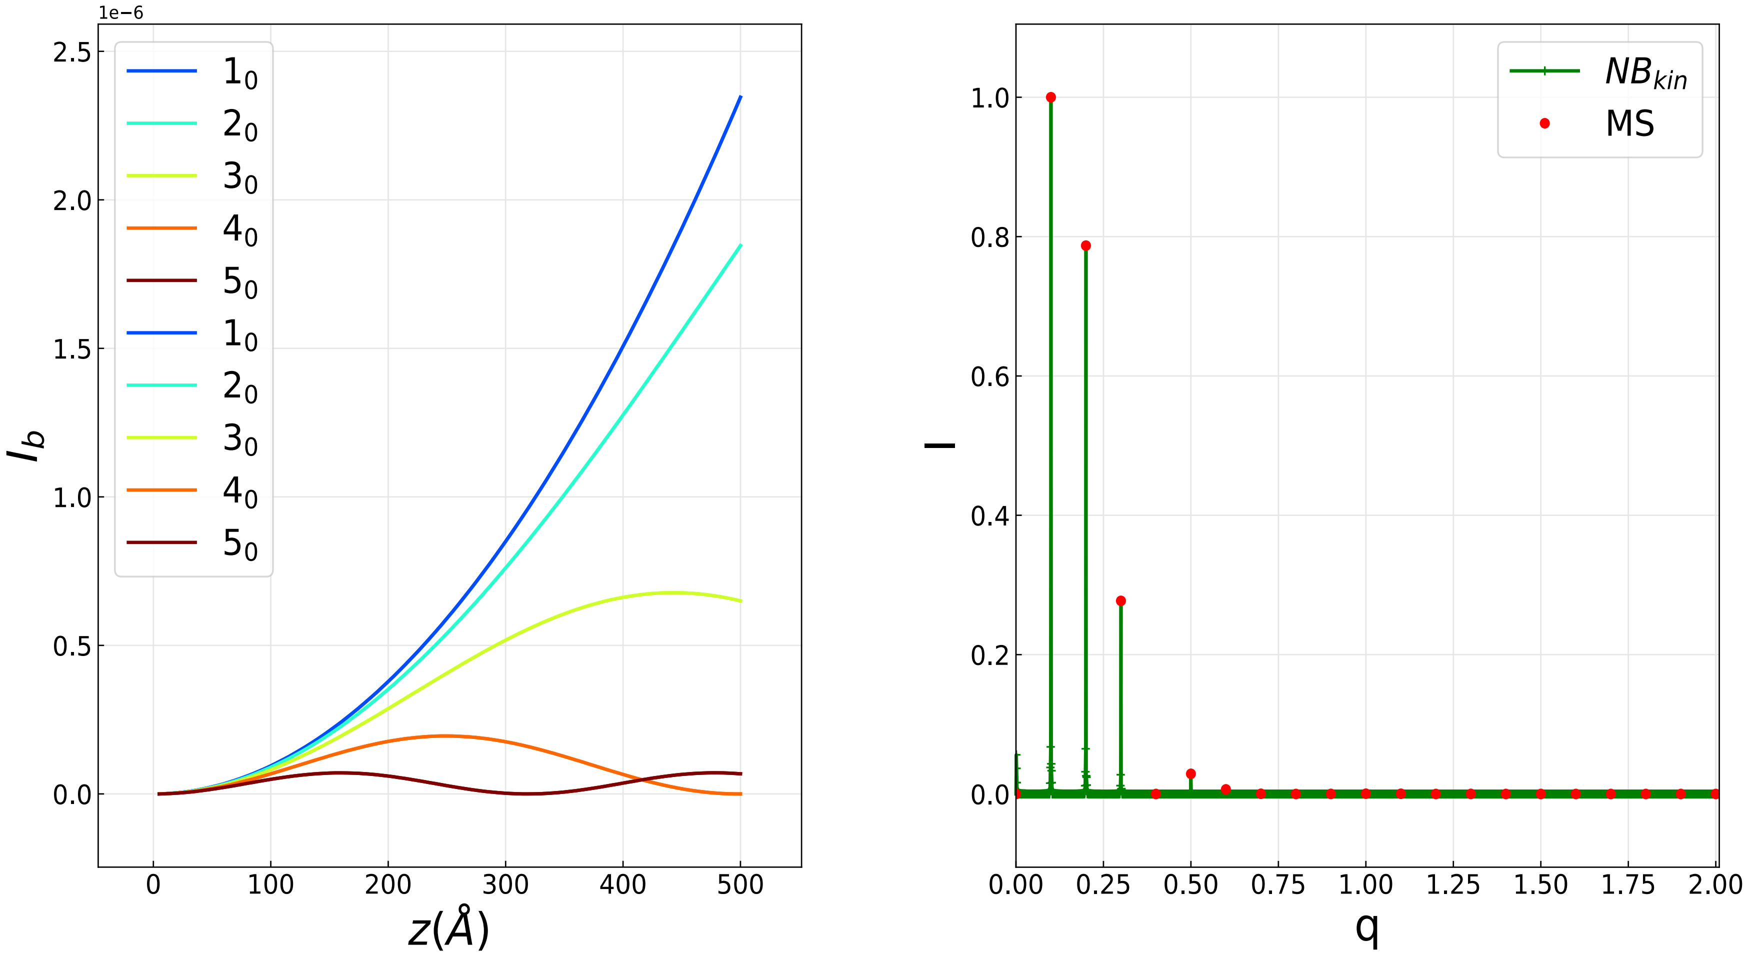
$$R_{il} \underset{Greens}{=} \sqrt{(x_i - x_l)^2 + (z_i - z_l)^2}$$

$$\underset{Fraunhofer}{\approx} (z_l - z_i) + \frac{x_l^2}{2(z_l - z_i)} - \frac{x_i x_l}{(z_l - z_i)}$$

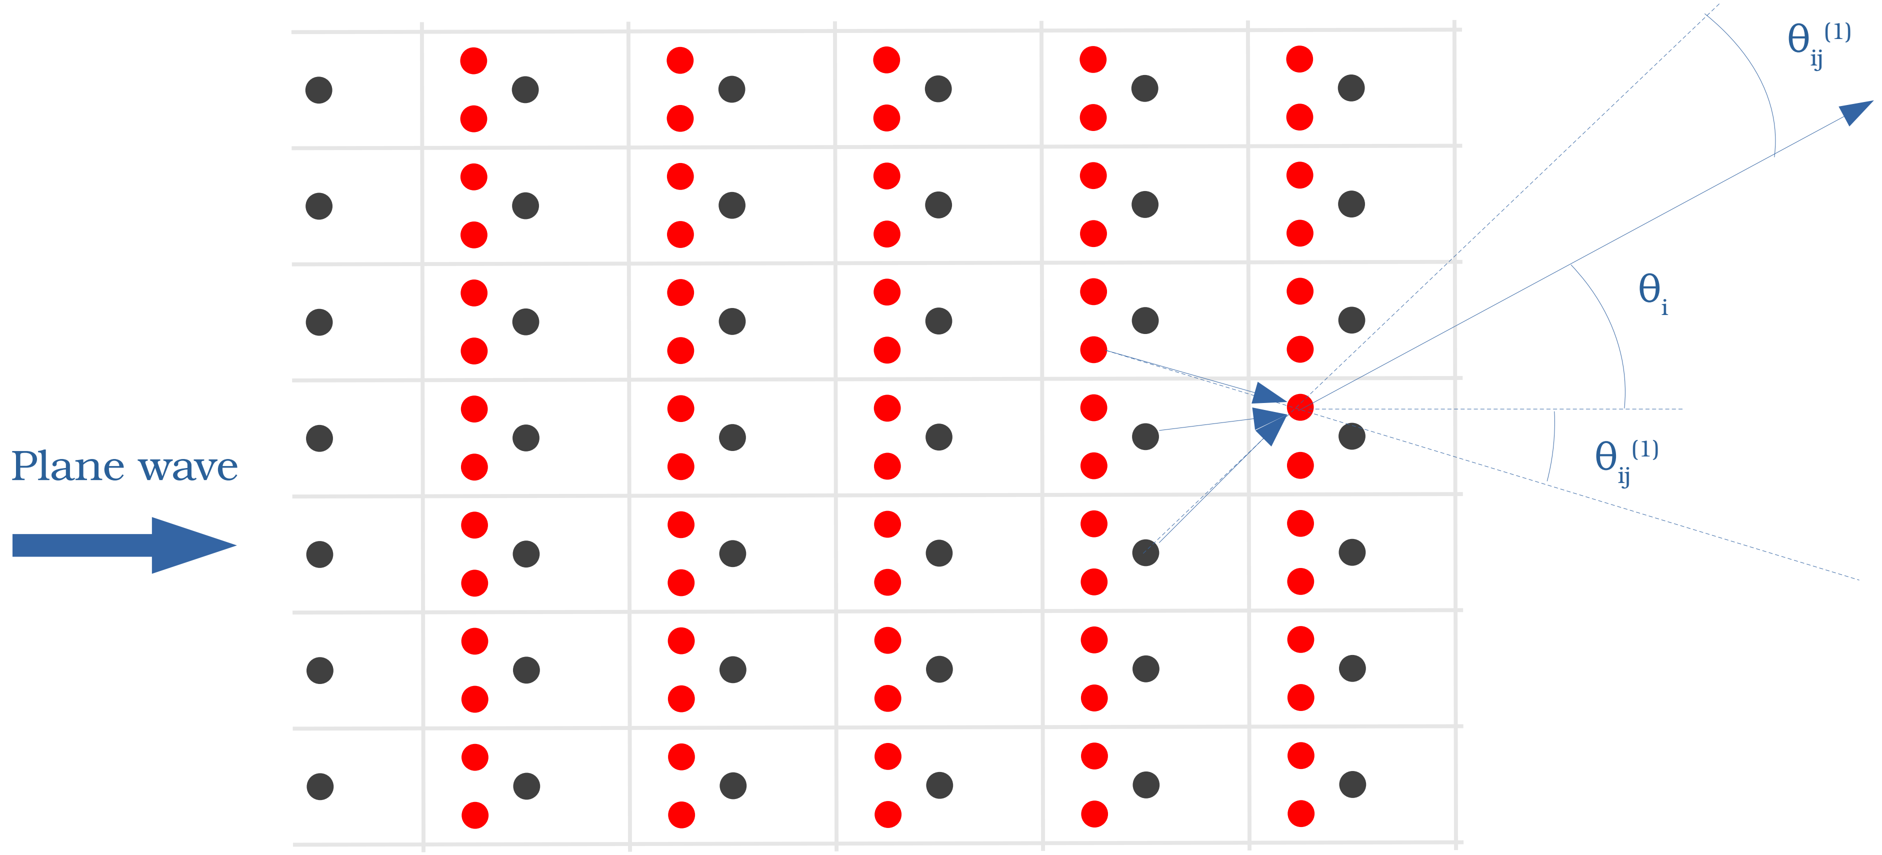
$$I_l = \left| \sum_{i=1}^{N} f(\theta_{il}) e^{jkR_{il}} \right|^2$$



Validation for the kinematic approximation



Extension to multiple scattering



Application to two scattering spherical atoms
